Central Asia has one of the most rapidly increasing HIV prevalence in the world. This research article describes the results of a study to assess current knowledge, risk behaviour and attitudes to voluntary counselling and testing concerning HIV/AIDS among pregnant women in Semey, Kazakhstan. The study concluded that pregnant women in Semey have poor knowledge about specific mother-to-child HIV transmission and do not know about the means of reducing mother-to-child HIV infection. However, most of the women in Semey were positive to prevention strategies for mother-to-child transmission after hearing about it.
